Well,

I was wrong about the access problems with one of the users. They were unable to access just a shared folder. However, they were able to access it in the past. She was part of a security group that accessed this folder. She was not in the group when I rechecked the share. I think that perhaps I reran the user permissions wizard which took her out of the security group. :-)

I am still working on the last user that is able to login but can't access Sharepoint or Outlook. He can access the shared drive.

John
