Mark -

I would strongly consider Good Technology. ActiveSync is ok but it is not efficient and there is no means to guarantee a message is sent/received. Activesync also sends the full email regardless of size - so if it has an 8mb attachment, it will send the 8mb attachment to the device before any other email is sent. Plus I don't believe it is multi-threading. Good and Blackberry use NOCs and have a acknowledgement architecture. Plus both are secure.

Blackberry touts they have over the air setup -- but it is all smoke and mirrors. You BB must already have 4.0 on it and even then you can only activate. With BB you will still need the desktop software. Out of the box it won't sink all your personal mailboxes, you still need to sync on the desktop. BB only works on BB Devices - No BB Connect devices are shipping in the US.

Good offers true over the air setup of GoodLink and third party applications. Your folders are sync'd out of the box, plus they sync notes, contacts, full calander. Plus they support more devices.

Regarding what PDA - Audiovox 6600 is the bomb!
