It seems you are not using Exchange to get mail from you provider if I understand you let your station go pick their mails on provider server.

In this case on the Protocol Rules you can find a rules "Small Business Internet Access Protocole Rule" that it is used by the station, in this rule you have only for protocol FTP Download, Gopher, HTTP and HTTPS, you can add POP3 and SMTP and normally the door will be opened.

But please, do not send 6 Mo of data over SMTP is not made this.

Better educate you customer to use ftp or other stuff more appropriated.
