SBS 2003 Standard, Dual Nics, Linksys Router, SBC Standard DSL (dynamic), No-IP.com services (free, not plus). All normal ports forwarded (4th install and have double checked the ports as being forwarded.

RWW used to work. I have been monitoring daily tape backups on the server, but hadn't in about 3 weeks. I went to give the client instructions on how to connect as they now want to telcommute, and as I was connecting the Cert comes up and when I accept the browser comes up with loading page but does not seem to error or time out. The cert lists the same as other certs I've installed in that it is servername.domain.local. I cannot seem to connect using <https://domain.no-ip.com/remote> (works fine with other installs by the way) or using the current <https://currentpublicip/remote>. I have turned off port 80 on all my installs and only connect via https. I went to this client today and checked out all the details, re-ran the remote access wizard from the to-do list, and connect fine from inside the network using <https://domain.no-ip.com/remote> and <https://currentpublicip/remote>. I tested it from both clients and felt confident all was now ok, but when I got back to my office I was unable to connect as before. I logged back on to all my other installs and compared settings, certs etc.. and all is by the book (harry's bible) so to speak. Then only real changes since it worked have been the window's updates. Has something been changed...?
