Can anyone point me in the right direction? I've inherited an installation using SBS2003 on which Routing & Remote Access has already been run. The first time this wizard it run it assumes nothing & ask first what connection type, broadband or dial-up. But now, when I come to run this wizard it presents different options: remote access (dialup or vpn), NAT, VPN & NAT...etc.

So, the question is, how do I get the wizard to start as if never previously configured?

Thanks in advance,
Nick.
