Greetings everyone!

I would like the advice of fellow users of SBS2k3. Our firm uses it currently for the following uses: Exchange email, our internet site, our intranet site via Sharepoint, a database server for our billing software, case file storage and My Documents redirection from 6 clients. We are now running out of hard drive space and I am wondering if I ought to just put an additional drive in to expand our storage, or should I just get us another server and use it as a file server? We are not really having any overhead issues thusfar with the server, a Dell PE600SC with 1.5GB of RAM and a 40 GB hard drive. ANy suggestions would be appreciated!
