John,

I have been through this with SBS before, but first off I need to clarify a few things.

Firstly, when you say you want the Novell Clients to see SBS as a Novell server do you mean that you want the clients to be able access resources such as data, network shares etc?

If so the only way I could get it to successfully work was to install the Microsoft Client for Novell networks. This is not the client that comes as part of your OS. It is a separate install / download from Microsoft. I can't remember the exact download location but I found it by browsing Microsofts documentation on Migration from Novell Groupwise to Windows 2003. The client will need to be installed on the clients. I don't recommend installing it on SBS though as it caused intermittent loss of network connectivity leaving me no choice but to reinstall the NICS and re-run the Internet config wizard Secondly I assume that you are running a Novell Server? Are you running groupwise?

You will need to ensure that the clients run the Workstation (full install) of Groupwise as opposed to the network install. Otherwise you will run into Groupwise API problems.

I would suggest that before installing the client that you uninstall the Novell Logon Client.

Unlike the Novell client which allows preconfig of such items as Logon Scripts etc you will need to do this through AD profiles or login script placed in the startup menu.

There are some other nitty grittys but this should point you in the right direction

Not sure if this helps, but good luck..

Steve
