Thanks for the response Tony.

It's not giving me the option one way or the other. The error message is basically saying that it can't establish a trusted relationship and assumes it's a permissions problem. At this point I'm logged in as admin and since windows authentication was used, I'm assuming that the admin account would have the necessary permissions for the installation. Maybe it doesn't. I'll go back and see if I can find something in the MELL documentation concerning this. But I also just on a whim tried to create a new database and register it. The enterprise manager wouldn't let me do it saying that the server (local) doesn't exist or access is denied. Again, I know enough to go huh?, but not enough to go "duh, I need to do this first".

Thanks

Cannon
