Hi All,

Used SUS to update SBS2K3 Premium with the latest updates. After reboot had major problems with DNS, Kerberos, DHCP, etc not starting. Also couldn't do a System State restore even though I could restore other data.

Finally decided to do a repair of the Windows installation and all went well. Had some errors on start up but no show stoppers that I know of.

Anyway, clients can logon but the logon script does not run. When they log off it can't find where to save the profile to. They can access e-mail and Internet but they cannot access the mapped drives on the server. Permissions look good too but I desperately need help.

TIA
