Hi,

If you open the properties of the folder, then you go to the Security tab, and finally click on Advanced you will then be able to stop the inheritance by unchecking "Allow inheritable permissions from the parent to propagate to this object and all child objects. Include these with entries explicitly defined here". At that point you will be prompted if you want to clear all the permissions or copy them as they are. Make sure you leave access for an administrator (or fallback user) and the account that is used to perform the backup of the system.

What type of problem are you seeing?

Regards,  
Damian
