Hi Zakir,

Well, that smart stuff is your problem then.

>From Brandy Nee, posted earlier in this newsgroup:

Error 0x80070057 returned from call to Adding routers IP address to the intranet zone().

What is your SBS server brand? Based on my experience, I believe your SBS server is HP/Compaq and you must have HP Smart Start or some other third-party software installed. It seems to be blocking/breaking new entries to go into the IE security zones. It is also setting the "Require server verification (https:) for all sites in this zone" checkbox on the local intranet zone. The third party product also seems to be removing the following registry key:

```
HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\InternetSettings\ZoneMap
```

To resolve this issue, you may need the following work.

1. Contact your third-party software vendor and make sure this software does not interfere with SBS server. Or totally remove it.
2. Make sure the above registry key is restored. You could import it from a known good user.
3. Rerun the CEICW and make sure it is finished successfully.

If you have any questions or concerns related to this issue, please let me know. I am looking forward to hearing from you.

Best regards,

Brandy Nee
