In a SBS 2003 environment three new Windows XP Pro machines have been purchased for the network. No changes were made to user accounts on the system.

After connecting the new machine to the network and joining the domain using the administrator account, the user of the new machine can not logon to the network with the error that the user is not allowed to logon interactively.

The user has had no issues for the past two years logging on and no changes were made other than trying to logon to the new computer.

The administrator account can logon to the new computer still.

Any idea why the user is now getting this error message?

Thanks,  
Dave
