Jerry,

We have been having a problem with our POP3 in trying to to configure our STD 2003SBS for a client to receive his email using the Default POP3 Virtual Server. Our server is resolving DNS with FQDN with all systems working well. The clients can retrieve mail locally with the same settings of mail.domain.com using the POP3 connector. The following msg is received on the client when trying to retrieve mail from the WAN." The specified server was found, but there was no response from the server. Please verify that the port and SSL information is correct." The server is found but logon is unable to process.

We have verified that the ports are correct 110/995 tried to connect with and without authentication. We are sending mail with no problem.

Any suggestions.

--

Thank you,
John
