Hi

I am experiencing a weird problem since upgrading a PC from Win98 to XP (SP2).

The PC has always been used by username "admin" & has a local HP laser which the rest of the network prints to.

Since the upgrade no one can use the printer when the username "admin" is logged in. All the print jobs sit in the queue.

As soon as "admin" logs out the printer will start & processes all the print queue. If any other user logs into the PC we have no printing issues.

I have set user "admin" permission levels to administrator but I still cannot get it to print.

Any ideas?

Thanks in advance

Peter

.
