We have SBS 2003 std that we've been using for a few months now. We now want to access the server remotely and setup Exchange. We have 1 NIC, do we need (or is it preferred) 2? The first NIC is a local IP 192..., do we setup the 2nd NIC with one of our public IPs? Is there something I need to do in our Symantec router (forward ports or something)? (It's not recognized by SBS.) Is it better if I use the VPN in the router?

Thanks.
