many thanks for your reply.

on the client side, outlook 2003 is loaded and the account is configured for connection to the exchange server, which in turn is connected as a pop3 connection. On the client side, the pop3 do not exist – this is configured via the pop3 connector in exchange. There is no option for any settings as you describe unless I install the email account as a pop3 account rather than as an exchange account (which incidently is my current workaround). any further suggestions gratefully received
