Hello everyone,
how can I check if SQL 2000 is properly installed?

I think I did the installation properly during the installation of SBS 2003 Premium,
but I every time appears an error ("there is no SQL 2000 on the Server installed")
when I start the SQL-SP4 Installation of SBS2003 SP1.

How can I guarantee that the SQL 2000 was properly installed?

Thanks for you help!!!

Best regards,
Michael Muhlack
