This will work im sure just tried similar setup seamed ok – What I dont understand is the PC had this program on it originally before it was ever added to the sbs network and when it was added using the connect computer with a user that only had USERS rights the application worked fine but new users have this permission problem – did the old user automatically get loacal admin priviliges even though she was assigned USER priviliges from the server or does the part in the setup where you add an administrators user and password somehow have something to do with it.

If you could clarify this for me I would be very gratefull.

Thanks – Mark
