The issue is not actually an issue, its by design... certain files etc.. simply can not be synchronized. If your workstations with redirected My Documents folders do not have synchronize offline folders enable, no problem. If you have laptop users who do and need access to certain files offline that are NOT synced then they will need to do manual copies... we recommend one folder for those files so they can copy them easily or see [link](#)

Numerous reasons for it but... although this may help change your needs
