I was one of those who eagerly installed W2003 sp1, only to roll back, then later install SBS2003 SP1. Works great with one problem... I can, no longer configure the M&R wizard (this is not the HTTP 400 error). Wizard comes up, steps through, then final configuration fails (all steps). Am getting following error in my application log:

SQL Server Scheduled Job 'SBS\_Database\_Cleanup'  
(0x1F7F470FB109034F8B0B9F444765B2C8) – Status: Failed – Invoked on:  
2005-07-24 03:00:00 – Message: The job failed. The Job was invoked by  
Schedule 5 (SBS Monitoring Database Cleanup Schedule). The last step to run  
was step 16 (DeleteInternetData).

ID of problem – or potential solutions appreciated....
