Hello all,

Since I upgraded my SBS2003 server with W2003 SP1 and SBS2003 SP1 (all according to the official update document from Microsoft) I am having troubles with some applications.

If I install a new application that needs MSDART.DLL I'm getting an error: "The procedure entry point DefWindowProcI could not be located in the dynamic link library MSDART.DLL"

This has to do with MDAC. Now on the microsoft site it says that I have to reinstall MDAC 2.8 SP1, but when I run ComChecker.exe it says that I have MDAC 2.8 SP2. The funny thing is that I cannot find SP2 on the Microsoft site. The version number of the MDAC dll's is 2.82.1830.0

Also my Veritas Backup Exec service won't start anymore which I assume have the same cause, and my sharepoint website is not available anymore which could be another problem according to the event log. But I will post this in another message (topic: Sharepoint and SBS2003 SP1)

Hope anyone can help!
Thanks in advance,
Berry
