I am trying to run reporting services on a SBS 2003 Premium server and have been running into a lot of issues.

I have installed the SQL Reporting Services Components on the server and the Visual Studio .Net components on my workstation. The goal behind installing the components in the specified locations include: report authoring on my workstation and finished reports available to all via the server.

The issues I have encountered include:

- 1) SQL Reporting Services activation error due to a conflict with Sharepoint. I have removed Sharepoint from the server as outlined in KB 829114. After completion of the Sharepoint removal, I reinstalled SQL Reporting Services and Reporting Services SP2 and was again informed that activation was not possible due to a conflict with Sharepoint. How do I work around this problem?
- 2) When accessing SQL Reporting Services from Visual Studio .Net on my workstation, I can open an existing project but I can't view content within the data sources tab. When trying to do so I get an error that states: "A connection cannot be made to the database. Set and test the connection string. Can't generate the SSPI context. How do I resolve this problem?"
- 3) When creating a new SQL Reporting Services project using the Report Wizard, the Shared Data Source field is blank and unavailable. Likewise, attempts to access shared data sources using the Server Explorer window result in the system prompting for a login when I try to select a listed in the tree under my server. I am unable to login using our available network or SQL User IDs.

My server is running SBS 2003 SP1 which includes SQL 2000 SP4. My workstation is a member of the domain for which the server is the PDC.

Is my topology realistic and can my problems resolved or should I relocate all components to the server? Even if located on the server, I will still encounter the activation problem and need a work around.

## Difficulty Installing SQL Reporting Services on SBS 2003 Premium

Thanks for your help!
