Joan,

I also upgraded to SBS SP1 and ISA 2004. I did not notice the problem right away because I was away for a couple weeks and I do not force permissions on directories everyday.

The workaround I am using right now is to login with a local admin account and add the permissions. I have to authenticate with the domain using a domain account that is not the domain admin, but it works. I still need to get this fixed and troubleshooting is taking longer than I would like because I am not able to just sit down and work on it.
