ÿ
you can't RWW from inside the network
Not sure why you would want to

From outside the network you need port 4125 open initially

what if you do: [http\(no s\)::servername.domainname.com\(or net or whatever\)/remote](http://servername.domainname.com(or net or whatever)/remote)

When I try and access my remote web workplace from inside the network or
outside, I get to the following page:
<https://FODN/Remote/logon.aspx?ReturnUrl=%2fRemote%2fDefault.aspx>, Then I
receive the following error:

The page cannot be displayed
A problem has occurred with the Remote Web Workplace. Close this browser
window, and then log on again. If this problem continues, contact the person
responsible for your network.

I am able to get to the server using the remote desktop connection
internally and externally. I am also able to use OWA internally and
externally. I believe I have opened all the necessary ports on my router.

I get the certificate screen, I have installed the certificate .. then
instead of a logon page I get the message above.
