Do all of the clients have to have access to the proxy in order to get internet even through ISA 2004 when they are in the Users group that I listed. Then what are the proxy settings, and how do I allow programs like Connected Online Backup or the VoIP Phones that we are getting get through that Proxy? If I allow all users is it essentially undoing what ISA 2004 is set out to do? Thanks.

Hi Aaron

Did you install the ISA Firewall client on the Workstations and insure that the IE connections tab is using the correct Proxy settings. Are you using [Https://address/remote](https://address/remote) or /exchange where address is FQDN or IP address which agrees with what you set the certificate to in CEICW?

Re: First time SBS 2k3 Premium install w/ ISA 2004 questions ???

I installed SBS 2003 Premium for the first time the other day for a business that I've been working for. I have had no experience with ISA 2004 up until this point. The server has two network cards, one with a direct connection to the internet and the other connected to a switch which connects to the rest of the computers on the network.

I installed the premium disc right after the set up finished and I was presented with the to-do list. I then ran all the wizards. The very first problem that I had with ISA 2004 was that none of the users could get internet access. The second to last rule is was that SBS Internet Users could get access, but even though all the users were added into this group I couldn't get it to work unless I changed it to say 'All Users'. I would like to use the Internet Users group though to restrict some people from getting internet access. Also, I'm assuming that rules must be processed from the bottom up because the last rule says to deny access to all internet traffic.

The next thing that I'm having a problem with is that I just tried to connect to OWA and RWW from outside the office and it isn't letting me. I was able to initiate Remote Desktop to the server, but nothing else. Again, I ran the wizzards and though that it would have opened up the correct stuff on ISA 2004 through the Remote Access wizzard.

Thank you. I'd really appreciate any help to explain this to me further.
