Hi,

Another tool we can use to list the established and listening ports is TCPView. TCPView is a Windows program that will show you detailed listings of all TCP and UDP endpoints on your system, including the local and remote addresses and state of TCP connections. TCPView also reports the name of the process that owns the endpoint. TCPView provides a more informative and conveniently presented subset of the Netstat.

We can download the TCPView tool from the following link:

<http://www.sysinternals.com/Utilities/TcpView.html>

Hope the information helps.

Best regards,  
Steven Wang (MSFT)
