I have been setting Up SBS servers lately with 2 sets of mirrored drives.

the Master Drive is an 80 gig drive I have partitined into a 30gig partition for the OS and the 2nd partition I put clientApps on . I also put customers software under client apps that is needed to deploy to workstations. One the master OS partition I follow the Pre installation enviroment and have all of the SBS cd's copied to the server along with MB driver cd.

The second set of drives I have nee installing vary from 120 gig to 200 gig depending on customer rquirements. It is here I put USer SHare Folders, Public, Fax Archive And Fax recieved. Exchange Mail Store.. and Special SQL instances..
