Hi Nee,

Thanks to repond me...

First i have give the answer the questines u have asked me..

a. What exact you mean "But if i have a direct IP machine i can connect the external machine". Do you mean that you can connect to the external machine from a client without ISA protected?

Yes.I can connect the external machinefrom teh client without ISA protected.

b. Do you mean internal clients want to use a third-party application to communicate with the internet server? A specific port will be used to connect to the external server.

Yes.I have developed a application.That application known as a client application.The external machine have a server application.Now i want to use the server(external machine) from my client application(internal machine).

Example:I will give some information about an user in the client application(internal machine).The application have to register the details into the server(external machine).

If i have connected directly with Internet the details are updated in the server(external machine).But if i behind in the ISA 2004 i details are not getting update in the external machine.

I hope you can understand the problem scenirio.

I have tried that way you gave.But Its not getting connect with the external machine.

Is any other way to Do that brandy nee..?

Regards,
Ganesan.J
