as long as the cert issued during CEICW is pointing to a name rather than an IP.

If the cert was issued to an IP the CEICW should be run again and a new cert created on the new IP.

If the cert was issued to a name then your FQDN DNS host just needs to update the A record for the name.

There can also be changes required if you are doing certain things in ISA and not using a router (ie. ISA direct to ISP, change ISP, get new IP, some ISA rules need adjusting). This is probably my main motivation for using a router between SBS (or any ISA) and the internet connection, a stable IP interface on the external network. Here I am not using stable in reference to stability of the ISP, I can change ISP, change connection type, have redundant ISP's or connection methods through the use of failover capable routers, no matter what I do the connection between the external ISA interface and the ISP is always the same IP config.

"Les Connor [SBS Community Member – SBS MVP]" <les.connor@xxxxxxxxxxx> wrote in message news:OmT7Xg2yFHA.2516@xxxxxxxxxxxxxxxxxxxxxxxxxxxx This is one of the major bonuses to a two nic SBS configuration – the IP address on the wild side is of no concern to the SBS.

Yes, a two NIC configuration with the 2nd one connected to the ADSL modem with a static public IP address (that is changing).

I realize there is a wizard to change the SBS2003 servers local LAN address
but what about if I need to change our Internet static IP.
All of the DNS naming and MX records will be the same, they will be changed
to point to the new IP address by our ISP.

Do I simply re-run CEICW?
What about the SBS-generated certificates – will they become invalid and need to be regenerated?

Thanks.
