Subject: Cached Password Issue???

[Reply to Author](#) | [Forward](#) | [Print](#) | [Individual Message](#) | [Show original](#)  
| [Report Abuse](#)

I have a notebook(XP PRO SP1)user who is unable to login to the domain. They are supplying the correct credentials at logon but are unable to connect to shares on the server. I have even gone as far as resetting the users password with a prompt for them to change it at next logon, which they get prompted to do, however they still cannot browse the server. I can manually connect to shares if I supply the same credentials however. I looked at the event viewer on the server and notice on the security log indicates an security fault indicating this user tried to authenticate with either an incorrect username or password. If I look at the users event log on their XP Notebook, I get the following entries:

anyone know what is going on and how to fix this?

Event Type: Error  
Event Source: Userenv  
Event Category: None  
Event ID: 1006  
Date: 4/16/2004  
Time: 7:19:33 PM  
User: TVPA\user1  
Computer: CPU1

## Cached Password Issue???

### Description:

Windows cannot bind to TVPA.local domain. (Invalid Credentials). Group Policy processing aborted.

Event Type: Error

Event Source: Userenv

Event Category: None

Event ID: 1030

Date: 4/16/2004

Time: 7:19:33 PM

User: TVPA\user1

Computer: CPU1

### Description:

Windows cannot query for the list of Group Policy objects. A message that describes the reason for this was previously logged by the policy engine.

+++++

Additional notes: This issue started after we implemented Active Directory in our environment.

We are on Windows XP/SP2. and use Group Policies.

It happenst intermitently and affects different accounts at different times. Usually after password is being changed, and to those who log into multiple computers. Sometimes in the middle of work, then if trying to browse a network drive I receive access denied.

Please advise. This is a serious problem.
