If the problem is widespread I would say your time syncing is not working. Kerberos will throw this error if there is significant enough mismatch in the time between servers and/or workstations.

Make sure that w32time is running on all the servers and that one of them has a reliable time source EG: ntp.yourisp.com or one of the stratum 2 time servers (Google ntp to locate a suitable one). A review of your event logs should confirm this theory by showing reds in the System log against w32time on the servers and workstations.
