I have just set up RWW on our SBS2003 server. In the process I used the email/internet wizard to set up the fire wall. After running the wizard I can no longer interact with my Symantec Router through the standard web browser (on the server or any client on the domain). If I plug a laptop directly into the router, the configuration utility works fine.

The SBS2003 has 2 nic cards; the WAN nic is connected to the Symantec router, which is connected to the internet. The router works fine, the internet works fine, (RWW works fine). I have no other obvious problems except that I can't ping the router from the server (or any other client on the domain), and I can reach the router configuration page from the server or any client (IE 192.168.0.1, the address of the router). The only way I can set up the router is to plug a laptop into one of the router ports.

It seems to be some firewall setting on the server is blocking the router local address, any suggestions? Thanks in advance.
