Hi,

I was reading this string, as well as the information provided in the links. One question does not seem to be answered.

How do I limit the size of the individual log file?

For example:

I transfer daily log files to a syslog server using FTP, however there is a limit of 2 gigs. On particularly active days, ISA will create multiple log files, the first one being (typically) over 2 gigs, then on to the second...

It would seem that the file size is arbitrary as each time it has happened the file size varies from 2.01 to 2.09 ??

Is there anyway to set this?

Thanks for your help

.
