Ok, found the problem. It seems that I had long ago, disabled Anonymous access for the Virtual SMTP Server, turned that back on and it works. But this brings up the question: why won't Fax Authenticate? It certainly has the option for it and I had it set to basic (same as my SMTP) and a valid user name and password entered.

While I dislike having Anonymous access on SMTP, I guess that I can live with it as long as I have relaying disabled!

Thanks for taking the time to help point me in the right direction.
