Trying to restore a users' mailbox by exmerging that mailbox from the SBS 2000/Exchange 2000 server and exmerging back into her mailbox on the swing-migrated SBS 2003/Exchange 2003 server.

The export worked fine (I can open that PST file without error in Outlook) but when I try to import into Exchange 2003 I get the following errors:

[14:29:20] Error opening message store (MSEMS). Verify that the Microsoft Exchange Information Store service is running and that you have the correct permissions to log on. (0x8004011d)

[14:29:20] Errors encountered. Copy process aborted for mailbox 'Cherie' ('CEP').

[14:29:20] Number of items copied from the source store for all mailboxes processed: 0

[14:29:20] Total number of folders processed in the source store: 0

[14:29:20] 0 mailboxes successfully processed. 1 mailboxes were not successfully processed. 0 non-fatal errors encountered.

[14:29:20] Process completion time: 00:00:00

Gotta be permissions, but I don't know why the domain administrator account can't do this? Are there special permissions or what?
