Thanks.

tsadmin opens Terminal Server manager.

Only logs there are over weeks old sessions perhaps still lasting as there isn't a log off column?

How do I log off from SBS2003 remote desktop, when I close connection?

I guess that remote desktop's start button and log off is not for disconnecting remote desktop sessions.

Hi,

I got " terminal server has exceeded max number of users ... " message yesterday when trying to access remote SBS.

There mustn't had been any other 2 users logged on. Also there isn't used any other terminal service services.

Is there a way to log remote desktoip users log on and log off times, so that I could diagnose later the situation?

Or to see clearly who is connected now through remote desktop?

mstsc /v:sbsserver /console

That will give you access to the server's console – aka the 3rd session

Then once you login, run tsadmin

Then log off the disconnected sessions

Is this on terminal server or SBS server? Your users are not supposed to

access SBS server remotely as that feature is there for remote

administration purposes only. RWW does not affect administrative sessions

to SBS.
