OK so I've moved everything back I think to c:\ This is so I don't get hassle if I have questions in the future and I will not be scrutinized as to why I have moved program files elsewhere.

When I went through the Server Tools interface, I selected everything to c:\ I was presented with a second box with the followings and it gave an option to install it on a different partition:

Intranet & SQL (can't recall exactly but similar)
ClientApps
User Shared Folders

I left all 3 on E drive. I know what the last 2 folders are for? As for the intranet entry, I know my company will eventually want to utilize this functionality to build an online library and therefore I have a feeling that the folder will get filled up with files quickly; did I install that correctly or should I move it back to C:\ also? I have miniscule knowledge of how intranet is built and so I will have to read up on it before fully utilizing it.

Generally it's best to re-install the program files if you change locations. Personally, I wouldn't put the server in production with what you have.

You want to get your hands on SBS SP1 slipstream media so you don't have to apply the service packs separately. You'll need them eventually anyway.

Les,

If I plan to put the program file back to c:\, would you have a shorter procedure in place?

It took me a GOOD two-hour and half or three to figure out the problem I had the first place and applying Service Packs. Now that I have installed the Server Tools on the E partition, if I want to change it back to C:\, I will have to reapply all the Service Pack again.

"Les Connor [SBS Community Member – SBS M]" wrote:

I don't think it's good practice to change the location of any of the SBS program files. Due to the tight integration, the dependencies are many. There's little to nothing to be gained by splitting program files up like that. It also complicates backup and restore in ways that will only come to light when the pressure is on ;-).

Take every opportunity to move growth items (data) off the system partition, but leave program files intact.

It's resolved. When changing the path of Server Tools etc, make sure

Re: SBS SP 1 installation error

to leave the path of installation folder. For example, when you point to another drive to install Server Tools, c:\program files\Server Tools -----it should install on say E drive as e:\program files\server tools and no just E:\.
