Confirmed with Andrew. I have the same setup as he.

SBS will work with more than 1 processor. I am setting up a new network right now with a dell powerededge server with dual Xeon processors. In fact they are Hyperthreaded processors so SBS sees this as 4 processors. If you go into Task Manager under Performance, how many processors is it monitoring? I got some kind of processor warning when doing the install as well, but I don't remember what it was about. Did you use the server assistant CD from Dell to get SBS installed? When you do this, it sets up all the drivers for SBS for hardware and such – maybe once the SBS is installed and these drivers take effect, the other processors are usable. I really don't remember anymore, but I can at least tell you that SBS will use the 2 processors – and supports Hyperthreading.
