Bring the laptop into your office – install on the LAN – set the laptop client to use Roaming Mode – disconnect from network...

What version of Trend CSM are you using? 2 or 3?

Regards,

David

One user has a laptop that will not be attached to the network for the majority of time. I want to install Trend CSM on the machine as we have the licenses. Anyone try this? how do I go about doing this? It wants to install a web server on the machine – is there any other simpler way or is this it?

thank you
