I have had a few problems on my network recently where files have gone 'missing' and nobody will admit to deleting or moving them. I want to enable auditing of all the files and folders within Company so I can go to suspected staff with hard evidence and give them the training they obviously need.

Steps I've taken so far:

1. Enabled auditing for 'object access' GP object (success and failure)
2. Forced GP update
3. Selected auditing on the Company folder, for group 'everyone' auditing for success and failure of delete and delete files and subfolders
4. Applied (took a while)
5. Tested it by creating a file within Company folder and then deleted it
6. Checked security event log for entry but nothing appeared.

Any ideas what I might have done wrong or steps I might've missed?

Thanks for any help...

Roddy
