Hi,

I've had a similar problem which started with activesync 4.1 not accepting my wm5 pda. I decided to purchase a CA SSL key and replace the self cert on my sbs 2003 server. This is where the problems have started.

I followed the same route as posted by Alex. Removed the self cert and requested a CSR. Purchased a third party Cert and installed it on the default web site. However when I go and run the Internet and Email wizard it won't accept the 3rd party SSL cert. I imported the cert into the personal section using the Certificates snap-in. However under ISA 2004 sbs web listener, it doesn't show up in the SSL list to choose from. What do I need to do?

You did import the certificate to the Computer Account store, right? If so, it should show up for both IIS and ISA since both work off that certificate store.

AIUI, the CEICW only supports the .CER format of certificate for assigning the certificate from within the wizard. All other formats must be imported directly, and the CEICW told "do not change the existing web server certificate".
