Have you checked domain security policy?

User Rights Assignments.> Access this computer from the network. by default is set to not defined...meaning no restrictions. There is also a "Deny Access to this computer from the network" also set to not defined

You may also want to check security options in the same domain security policy and see if any restrictions exist?

Cris Hanna [SBS-MVP]

Please do not respond directly to me, but only post in the newsgroup so all can take advantage "Rick Gourley" <RickGourley@xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx> wrote in message news:78A3AEE3-A845-4F51-BE59-D6624D451896@xxxxxxxxxxxxxxxxxxxx

I have a client running SBS 2003. Users are suddenly unable to logon to the domain when they are in a security group. If I create a new user and do not add them to any groups beyond the defaults that MS assigns, they can login with no problem. However if I add them to any security groups they cannot login, after about 10 minutes of saying "applying personal settings" it logs on locally with cached credentials. I even created a new security group to see if my existing groups had become corrupt, same results. Any help would be greatly appreciated.

Thanks,
Rick
