There is only 1 NIC and I have rebooted the server several times.

It seems like I have solved it, but I don't know what made it work again. This is what I did anyway:

- Disable VPN (remote access), which disabled Routing and remote access service, which was the service interfering with Windows Firewall
- Start Windows Firewall worked then and in the settings I disabled the Windows Firewall
- Group Policy – disabled (choose not configured) all settings about Firewall. I found another posting about that.
- Then it worked again and I have re-configured the VPN service again

Best regards
Niklas
