Hi,

Thanks for your update.

I am sorry for the delayed response due to weekend. Please understand that the newsgroups are staffed weekdays by Microsoft Support professionals to answer your systems and applications questions. Your understanding is greatly appreciated!

If you don't publish the folder link to internet, you can use the method. This is no security consideration. When we enable web sharing feature to share folders, the Web Distributed Authoring and Versioning (WebDAV) server is enabled. And we will enable the WebClient service on XP clients to access WebDav resources over HTTP. The WebClient service enables Windows-based programs to create, access, and modify Internet-based files using Win32 APIs.

However there is a known issue with the Web Client service running on XP. The symptoms as follows:

1. After you type your password at the logon screen, the computer may appear to stop responding (hang).
2. During the logon process, you see an "Applying Computer Settings" message for several minutes. However, you can log on the same computer quickly when the network connection is unplugged.
3. There is a long delay when you try to open a network share.

For more detail information, I suggest that you take a look at the following information:

You experience a delay when you use your Windows XP computer to log on to a domain or to connect to a network resource
<http://support.microsoft.com/?id=832161>

If you have more than one servers that hold shared resources and you want to manage them centrally, we can setup DFS to achieve your needs.

RE: Sharepoint upload question

Distributed File System (DFS) allows administrators to group shared folders located on different servers by transparently connecting them to one or more DFS namespaces. A DFS namespace is a virtual view of shared folders in an organization. Using the DFS tools, an administrator selects which shared folders to present in the namespace, designs the hierarchy in which those folders appear, and determines the names that the shared folders show in the namespace. When a user views the namespace, the folders appear to reside on a single, high-capacity hard disk. Users can navigate the folders in the namespace without needing to know the server names or shared folders hosting the data.

For more information on DFS, please refer to:

DFS Technical Reference

<http://www.microsoft.com/technet/prodtechnol/windowsserver2003/library/TechRef/20ffb860-f802-455c-9ca2-5194f79a9eb4.mspx>

Distributed File System and File Replication Services

Distributed File System (DFS) – Best Practices and Troubleshooting Guide

<http://www.microsoft.com/technet/prodtechnol/windows2000serv/support/dfsbpspx>

I hope this helps. If you have any questions or concerns on the issue, please feel free to let me know. I am happy to be of further assistance.

Have a nice day!

Sincerely,

Jenny Wu

The one thing about being very insecure. We are behind a VPN router and
will

not be putting this out on the net. How insecure is this method versus giving our end users access to the folders via regular folder access?

""Jenny wu [MSFT]"" wrote:

Hi,

RE: Sharepoint upload question

Thanks for using the SBS newsgroup.

From your description, I understand that you have problem to web sharing some files on companyweb. If I am off base, please don't hesitate to let

me

know.

When we open one folder's Properties page, under Web sharing tab, by default, it first will show the status that the folder is sharing on "Default Web site". You can choose the companyweb item in dropdown list

and

then you can see the alias of the folder shared on companyweb. In doing

so,

you enabled webdev to make the folder can be accessed using http. To

share

folder in companyweb, you need also add the path to exclude path in Sharepoint Central Administration to pass the ISAPI filters. You can do

as

follows:

1. Open the Sharepoint Central Administration site (Start -> Programs -> Administrative tools -> Sharepoint Central Administration).

2. Under virtual server configuration, please select extend or upgrade virtual server. and click companyweb under Virtual server list to go to companyweb VD configuration page.

3. Under virtual server configuration, please select define managed

paths

and enter the name of the folder and choose Excluded path type under add

a

new path.

However the method is very insecure since these folders are saved in metabase. It will increase your network resources security risk.

From your description, I understand that you want to upload files to

RE: Sharepoint upload question

companyweb so that domain users can access them.

To do so you can directly open companyweb site, create document library

as

you needs and then upload the files to the library.

Hope above information helps. Please let me know if you have further question on the issue. I am happy to be of assistance to you and look forward to your reply.

Have a nice day!

Sincerely,

Jenny Wu

I have a folder that I want to give access to. When I right
click on

the

RE: Sharepoint upload question

RE: Sharepoint upload question

folder go to properties and go to web sharing i have the ability to

select

companyweb. I select the share this folder and hit Companyweb and hit

OK.

When i go back into the folder properties it changes it to Default Web

site.

I was wondering if that is ok? and second how do I give users access

to

this

folder and the files in it now?
