Hi, this may possibly be in the wrong place, but I think it relates more to 2k3 permissions than Dos.

On our SBS2003 server I have created a hidden share called images\$. The ntfs and share permissions are set to allow the 'everyone' group full access.

I have a floppy disk that boots up pc's on our network using DHCP.

When I run the net use command with the following syntax:
net use z: \\server\images\$
I get asked for the password.
Any ideas why?

The floppy is set to use the Administrator name and via system.ini to connect to the correct domain name and 'logged on' – although not authenticated as is Dos.

Whatever password I type in, I get told that it is incorrect.
If I try:
net use z: \\server\images\$ /USER:domain\Administrator
I get a message back saying /USER:domain\Administrator is an unknown switch.

I don't know if my net.exe is an incompatible version, or if I have missed something in the sharing process on the server.
Ideally I would like to set the folder / share permission to allow anonymous access (basically let anyone in – it is only for PC images)

We had a similar issue with Ghost, it is because of the fact that the 2k3 domain controller requires signed SMB messages and the DOS client doesn't support this. Just search for Windows 2003 access from Linux, here is one such article:
