Hi John

Terminal Services is disabled in Application mode in SBS. You can login with 2 sessions to administer the server but to run an application you need a member server running Terminal Services. If you are running Standard be sure you have a good Firewall Appliance or upgrade to Premium for security. I suggest that you may want to get a Small Business Specialist to Consult with you to set this up for you properly. We have an MVP in Atlanta if you would like me to put you in touch with him or you can do a search at http://www.microsoft.com/smallbusiness/partner/vendorsearch.aspx?_EVENTTARGET=&_EVENTARGUMENT <http://tinyurl.com/jdrzh> and select one there who has several references you can check.

We will be happy to answer your questions for you but the error you get indicates you may not have completed the todo list completely and/or may not be logging in to the connect Wizard as Administrator.

I am about a week and a half deep into SBS Standard 2003 at my office. The goal is to get my branch in ATL and my partners branch in New Orleans to share this database program the 2 of use. The program maker has told us it works best using Terminal Server.

The problem is, I can't seem to get newly created users/computers configured correctly. I'm using an external DLink router to handle dhcp as I'm to clueless to try to set it up on sbs right now. I get through the whole "add user/client computer" stage up until I get to the window that pops up and says "goto "\\server\ConnectComputer'". When I do this on a connected client at the office, I enter my user and pass and get the error:

"The list of users and computers cannot be found.Make sure the client

Re: Please help me as I am clueless at this point!

Re: Please help me as I am clueless at this point!

computer has a wired connection (paraphrasing)If you have a router controlling DHCP, make sure the computer running sbs is set to be the primary DNS."

----It is, at the reserved ip of 192.168.0.101

When I try to get through this stage from home on a client computer,I get:

"You are not authorized to view this page.
HTTP Error 403.6 – Forbidden: IP address of the client has been rejected.
Internet Information Services (IIS)"

I have all IP's allowed right now in IIS, so I have no idea where this is coming from.

Any ideas would be welcome. All I need in life is to get this thing working where 2 people can log into terminal server to use one program.

Thanks for any help!!!
