a valid concern.

You should install all the Server 2003 updates now available, I have on both all production and my test systems.

as to the future, I can only advise 'watch this space' and wait a short period after updates are released before applying them. Many of us run test systems that we apply the updates to before allowing production boxes to get them. I realise a 'part time admin' can't always do this. (I'm also getting a bit slack, actually not always releasing to the test systems, instead dropping them onto the LoungeAN SBS and crossing m' fingers)

"Mike Teegarden" <[miket@xxxxxxxxxxx](mailto:miket@xxxxxxxxxxx)> wrote in message [news:1293hepcut6ra5@xxxxxxxxxxxxxxxxxxxxxxxx](mailto:news:1293hepcut6ra5@xxxxxxxxxxxxxxxxxxxxxxxx)

Thank you, Dave. You may have misunderstood my concern. I have installed SP1. I was referring to when several people downloaded the SP1 release for Windows server 2003, which was specifically NOT to be used with SBS. I am not a full-time IT guy, so the last thing I want to do is install something that will cause me grief. My concern is telling WSUS to check for Windows Server 2003 updates, and then knowing which of those are OK to install on SBS 2003.

By the way, thank you for all your help.

Dave Nickason [SBS MVP] wrote:

I have separate GPOs set up for servers and workstations. Workstations auto download and install, servers auto download and notify. I then manually install updates on the servers as fits my schedule. I usually do them on the Saturday after patch Tuesday, by which time I would expect to have heard about any major issues. I like the idea of waiting a few days, but I never wait long, especially for the SBS. My other servers are pretty well isolated behind the SBS, but I want that server to be up to date on anything security-related.

Re: WSUS SP1

If you look at the tens or hundreds of thousands of people who have installed SBS SP1, compared to the few who have had issues, I think it's clearly less risky to install updates than to attempt to do without them. Not only in relation to SBS, I think this of all MS patches – there have been fewer issues, and less all the time, not to mention that they support them for free.

Currently, the only updates I don't have approved in WSUS relate to products I don't have installed – IE7, 64 bit, etc.

That seemed to be the problem. Once I changed the setting to include Windows Server 2003 files, it downloaded. I still had to go find WSUS SP1 and tell it to install, but at least it was there.

What do I do with the Windows Server 2003 updates that it wants me to install? I have been afraid of those give what happened a year or so back when SP1 for 2003 Server came out.

Could it have to do with what products I have it looking for. I do not have Windows Server 2003 selected. I do have SBS 2003 selected though.

the WSUS

Re: WSUS SP1

SP is not actually defined as a 'WSUS Update', the WSUS components appear in the update list with a different icon, also I have my LoungeAN set to automatically approve the WSUS components, the SP had to be manually approved.

I can only suggest manually telling WSUS to sync, see if it syncs successfully, possibly after first going into the download types and modifying it first NOT to do SP's, then back to do so.

Are  
you  
sure  
it  
didn't  
download  
itself,  
approve  
itself,  
and  
install?  
One  
of  
the  
auto-approve  
options  
is  
to  
automatically  
approve  
WSUS  
updates,  
and  
that  
might  
be  
enabled  
by  
default.

What's  
your  
build  
number  
on  
the  
bottom  
of  
the  
WSUS  
home  
page?  
SP1  
is  
2.0.0.2620.

I'd  
assume  
selecting

Re: WSUS SP1

SPs  
would  
include  
this  
one,  
but  
I'm  
not  
sure.  
I've  
got  
everything  
enabled  
except  
drivers.

Odd.  
I  
didn't  
get  
it.  
I  
do  
have  
it  
setup  
to  
get  
service  
packs.  
Is  
there  
a  
way  
to  
force  
it  
to  
pull  
it  
down?
