Hello Everyone:

Third attempt: sorry, but mystery solved. The date on this workstation was June 7. I am going to try this again, on the premise that most sort on date order??

Client has two servers. Server1 is SBS 2003 with ISA 2004. Two nics, "internal" = 192.168.16.2 "external" = 192.168.1.2 Server2 is plain jane windows server (nt40----i know-i know) 192.168.16.3 and 192.168.1.3.

Server2 hosts the public web site for the company, www.publicwebsite.com.

Under SBS 2000, ISA 2000 we had an ISA rule to publish the public web site and it worked most of the time. Under SBS 2003 there are additional services using port 80, so the rule does not work as expected.

Cannot use the router to port forward 80 to Server2, since this will break the functionality of SBS

Does anyone know of a rule, a white paper, or can suggest a rule that will allow us to continue to enjoy all the SBS services and also allow public assess to www.publicwebsite.com on Server2?

Thanks for your help.
