I am getting a vbscript internal error using RWW on 2 out of 6 connections. To give a little background on my setup, I have a main office with a SBS 2003 server and 6 remote offices running XP SP2 connecting via VPN to the domain so they can be accessed through RWW. The 2 problematic PC's are not always failing. Sometimes I do manage to get through to them. I have done some checking and the VPN tunnel is always up when it is working and when it is not working. I am kinda at a loss for the moment. Any help would be appreciated.

Justin
