Hi Jason,

Thanks for posting here.

From your post, my understanding on this issue is: you get Event 1053 error message in Event Viewer. If I am off base, please feel free to let me know.

Based on my research, the event ID 1053 issue may occur if you have account names that use non-ASCII characters. Windows 2000 Server and Windows Server 2003 do not distinguish between non-ASCII and ASCII characters in account names. To resolve this issue, you must either delete or rename the conflicting accounts.

Also, please ensure that the appropriate groups are listed in the "Access this Computer from the Network" permission. You can find this permission in the following folder:

Computer Configuration\Windows Settings\Security Settings\Local Policies\User Rights Assignment

The following groups have the "Access this Computer from the Network" permission on domain controllers by default:

- Administrators
- Authenticated Users
- Everyone

Following are some useful Microsoft Knowledge Base articles for your reference:

Event ID 1053 and 1058 appear in the Application log after you upgrade to Windows 2000 Server or Windows Server 2003 with Active Directory

RE: Userenv errors

If the issue still persists, please collect some additional information for my further research:

1. Have you performed some specific operation before discovering the issue?
2. What's the detailed symptom of the specific issue except for the event mentioned in the post?
3. Does the issue occur when using a specific user account or every use account in your domain?

Please try the suggestions above and let me know the results at your earliest convenience. If anything in my response is unclear or you need further help, don't hesitate to post back.

Thank you for your time and cooperation.

Have a nice day.

Best Regards,

Steven Zhu
